

## Conversion of production on BPA-free products is proceeding according to plan

From 2020, the sale of thermal papers containing bisphenol A (BPA) will no longer be permitted in the European Union.

KANZAN has extensive experience with alternatives to BPA. Many varieties have always been produced with bisphenol-free feedstocks, others were already converted in 2018.

Now KANZAN is converting its last products containing BPA. These are our grades KF 50 and KP 460, which are used e.g. in the field of sales receipts and self-adhesive labels. In future, our customers will be able to choose between bisphenol-A-free products and products that are manufactured entirely without bisphenols.

The last production containing BPA will take place in May. KANZAN will be completely BPA-free after the sale of the stocks. Our new products KF 50 BPA-free and KP 460 BPA-free are available immediately.

In case you have any questions, please do not hesitate to contact Ms. Andrea Hürfeld from our corporate communications department or our entire sales team.
